Research Title	: <u>CONGENITALLY CORRECTED TRANSPOSITION OF THE GREAT ARTERIES WITH EBSTEIN MALFORMATION AND HYPOPLASIA</u> <u>CONGENITALLY CORRECTED TRANSPOSITION OF THE GREAT ARTERIES WITH EBSTEIN MALFORMATION AND HYPOPLASIA</u>
Descriptipn	: Congenitally corrected transposition of the great arteries is not uncommonly associated with Ebsteins malformation of its lift-sided tricuspid valve. The recognition of this rare association in the fetus is important because its postnatal prognosis is guarded. The present case report illustrates fetal echocardiographic clues to the diagnosis that include mesocardia and apically displaced attachment of the lift-sided atrioventricular valve to the ventricular septum atfour-chamber view
